Installation Quick Guide

Simplify your network installation with our Keystone Jack Assembly Tool & set – designed for effortless precision and speed. Strip 4 cm of the network cable using the integrated cutting blade, then rotate and pull the cable for a clean strip. Separate the 8 individual wires and insert them into the metal sleeve until the exposed section is fully covered. Arrange the wires by color into the designated slots of the plastic cap for a secure and organized connection.

Next, align the arrows on the Keystone Jack and plastic cap, and place the assembly into the crimping tool. With a single motion, the handle presses the cap onto the jack, securing the wires firmly in place. Finally, snap the metal sleeve into position to complete the installation. Quick, accurate, and professional result.
